Chapter 5

技巧

5.1 真正的释放 STL 容器内存空间

```
1 template <typename T>
2 __inline void clear(T& container) {
3     container.clear(); // 或者删除了一堆元素
4     T(container).swap(container);
5 }
```

5.2 无敌的大整数相乘取模

Time complexity $O(1)$.

```
1 // 需要保证 x 和 y 非负
2 long long mult(long long x, long long y, long long MODN) {
3     long long t = (x * y - (long long)((long double)x / MODN * y + 1e-3) * MODN) % MODN;
4     return t < 0 ? t + MODN : t;
5 }
```

5.3 无敌的读入优化

```
1 // getchar() 读入优化 << 关同步 cin << 此优化
2 // 用 isdigit() 会小幅变慢
3 namespace Reader {
4     const int L = (1 << 15) + 5;
5     char buffer[L], *S, *T;
6     __inline void get_char(char &ch) {
7         if (S == T) {
8             T = (S = buffer) + fread(buffer, 1, L, stdin);
9             if (S == T) {
10                 ch = EOF;
11                 return ;
12             }
13         }
14         ch = *S++;
15     }
```

```
16  __inline void get_int(int &x) {  
17      char ch; bool neg = 0;  
18      for (; get_char(ch), ch < '0' || ch > '9'; ) neg ^= ch == '-';  
19      x = ch - '0';  
20      for (; get_char(ch), ch >= '0' && ch <= '9'; )  
21          x = x * 10 + ch - '0';  
22      if (neg) x = -x;  
23  }  
24 }
```

5.4 控制 cout 输出实数精度

```
1  std::cout << std::fixed << std::setprecision(5);
```
